System Overview and Architecture

LON-CAPA Overview

- LON-CAPA is
 - free
 - open-source
 - a learning content management system
 - an assessment system
 - around since 1992

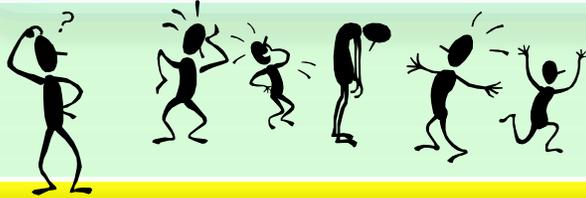

Free and Open-Source

- Free:
 - “Free beer”: no licensing fees
 - “Free speech”: source code, Bugzilla, mailing lists, research results, all out in the open
- Open-source: you can read, modify, improve, adapt, etc, the original code of the system
- BUT: derivative must be distributed under same license, i.e., GNU General Public License

```
while ($line=<IN>) {  
    chomp($line);  
    $line=~s/\s+$//s;  
    $line=~s/\"//g;  
    $line=~tr/A-Z/a-z/;  
    @entries=split(/\/,$line);  
    $username=$entries[4];

EXAMPLE

Example: Looping

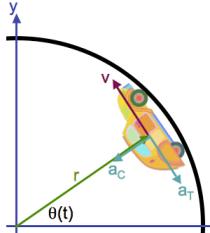

A toy car can go through a looping if it is fast enough. What are the forces that act on it? How fast does it have to be?

The motion is obviously circular, but non-uniform: the car will slow down on the way up, and speed up on the way down. With r being the radius of the looping, the x -axis horizontal, the y -axis pointing up, the origin being in the center of the looping, and $\theta(t)$ being the angle, the position of the car is given by

$$\vec{r}(\theta) = \begin{pmatrix} r \cos(\theta(t)) \\ r \sin(\theta(t)) \end{pmatrix}$$

as long as it does not fall off the track.

The figure below illustrates the setup:

EXAMPLE

Focal Length

The following pictures are taken from the same vantage point with three different zoom lenses:

- 17mm-35mm wideangle zoom
- 24mm-70mm normal zoom
- 70mm-300mm tele zoom

using a digital camera with an image sensor of 24mm x 36mm (standard so-called 35mm image format).

17mm extreme wide angle

35mm mild wide angle

24mm wide angle

48mm normal

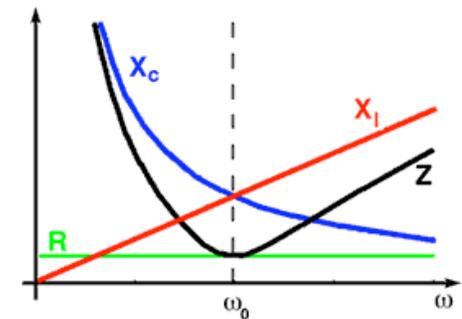

Impedance

The addition of the three currents (through the resistor, the inductance, and the capacitance), each of which is 90° out of phase with each other, in quadrature yields:

$$\begin{aligned} V &= \sqrt{V_R^2 + (V_C - V_L)^2} \\ &= \sqrt{(IR)^2 + (IX_C - IX_L)^2} \\ &= I \sqrt{R^2 + (X_C - X_L)^2} \\ &= IZ \end{aligned}$$

where I is the current, X_C and X_L are the [capacitive](#) and [inductive](#) reactances, respectively, and Z is the [impedance](#). Putting in the values of the reactances, we obtain for Z :

$$\begin{aligned} Z &= \frac{V}{I} = \sqrt{R^2 + (X_C - X_L)^2} \\ &= \sqrt{R^2 + \left(\frac{1}{\omega C} - \omega L \right)^2} \\ &= \sqrt{R^2 + \left(\frac{1}{2\pi f C} - 2\pi f L \right)^2} \end{aligned}$$

and has its minimum of $Z = R$ when

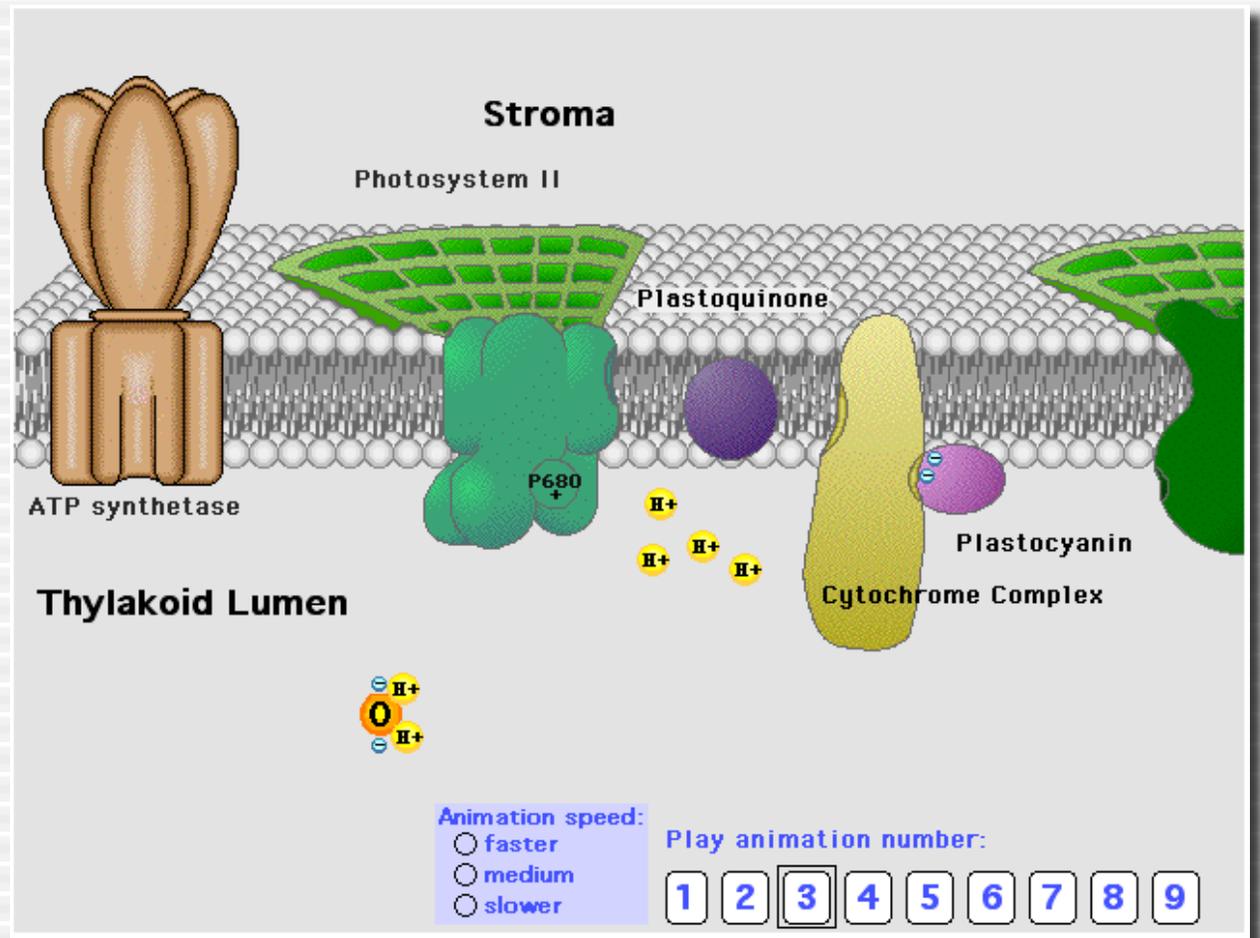

$$\omega_0 = (LC)^{-1/2},$$

pure LC circuit. This is the [resonance frequency](#) of the RLC circuit. The impedance and of the reactances is shown in the figure.

have to be added in a special way. They end up as a single quantity Z , the [impedance](#) of the [circuit](#).

Shared Resource Library

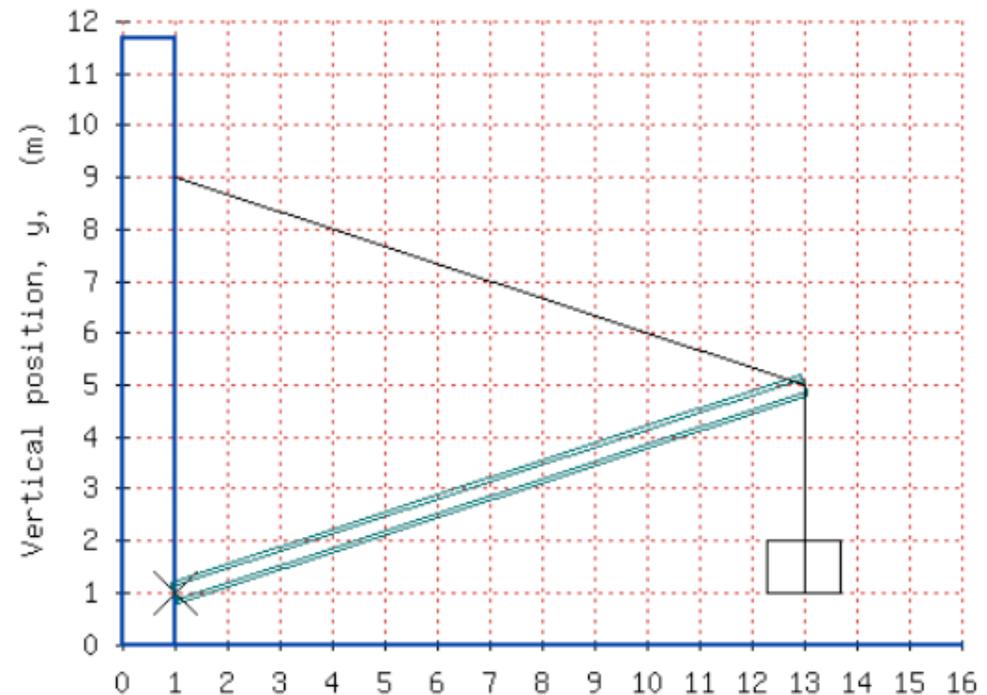

- ... or simulations and animations ...

Shared Resource Library

- ... or this kind of randomizing online problems (distintos problemas gerados online)

A crate with a mass of 155.5 kg is suspended from the end of a uniform boom with mass of 89.5 kg. The upper end of the boom is supported by a cable attached to the wall and the lower end by a pivot (marked X) on the same wall. Calculate the tension in the cable.

Shared Resource Library

- ...special emphasis on math
 - including support of
 - LaTeX
 - Maxima
 - R

Give an example of a function

1. which is orthogonal to $6\cos(7x) - 2\sin(2x)$ with respect to the scalar product

$$\langle g | h \rangle = \frac{1}{\pi} \int_{-\pi}^{\pi} dx g(x) \cdot h(x)$$

2. whose norm is 1.

cos(2x)+sin(7x)

The function you have provided does not have a norm of one.

Submit Answer Incorrect. Tries 1

What is the derivative of

$$\begin{pmatrix} 4t^3 \\ 8t^8 \end{pmatrix}$$

with respect to t ?

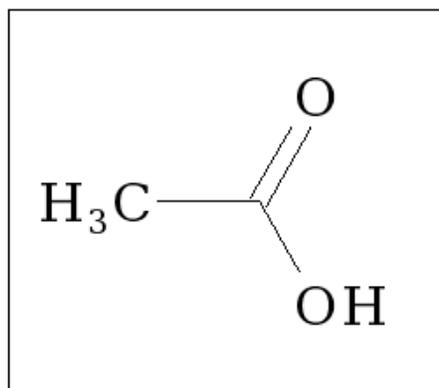

You need to multiply with the original exponent.

Submit Answer Incorrect. Tries 1

Elevator Problem

Due never

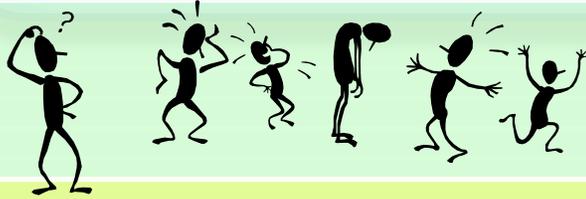

An elevator (cabin mass 500 kg) is designed for a maximum load of 2600 kg, and to reach a velocity of 3 m/s in 5 s. For this scenario, what is the tension the elevator rope has to withstand?

Online Discussions

The plot shows the trajectory (height versus distance) of an object launched at an angle of 75.6 degrees. What was the initial speed of the object? **4.0 m/s**
Computer's answer now shown above. Tries 0/12

[Threaded View](#) [Chronological View](#) [Sorting/Filtering options](#) [Export?](#)

Anonymous 1 (Fri Sep 22 01:26:29 2006 (EDT))

any hints to start?

Re: *Anonymous 2* (Fri Sep 22 01:56:48 2006 (EDT))

You need to find the Y component of velocity... you can do this by finding the height traveled (notice it does not start on the ground) and combining that with acceleration in a kinematics equation. From there use trig to get the original velocity.

Re: Re: *Anonymous 1* (Fri Sep 22 12:10:37 2006 (EDT))

how can we find the height traveled and how can we get the acceleration if we don't have the time?

Anonymous 3 (Fri Sep 22 16:41:27 2006 (EDT))

i'm lost on this one... can anyone help?

Re: *Anonymous 4* (Fri Sep 22 20:02:45 2006 (EDT))

Use the squared kinematics equation - so $V_f^2 = V_i^2 + 2a(X_f - X_i)$.

Discussions

Encouraged, since all students have different versions. Peer-Teaching. (Discussões online como estratégia de ensino)

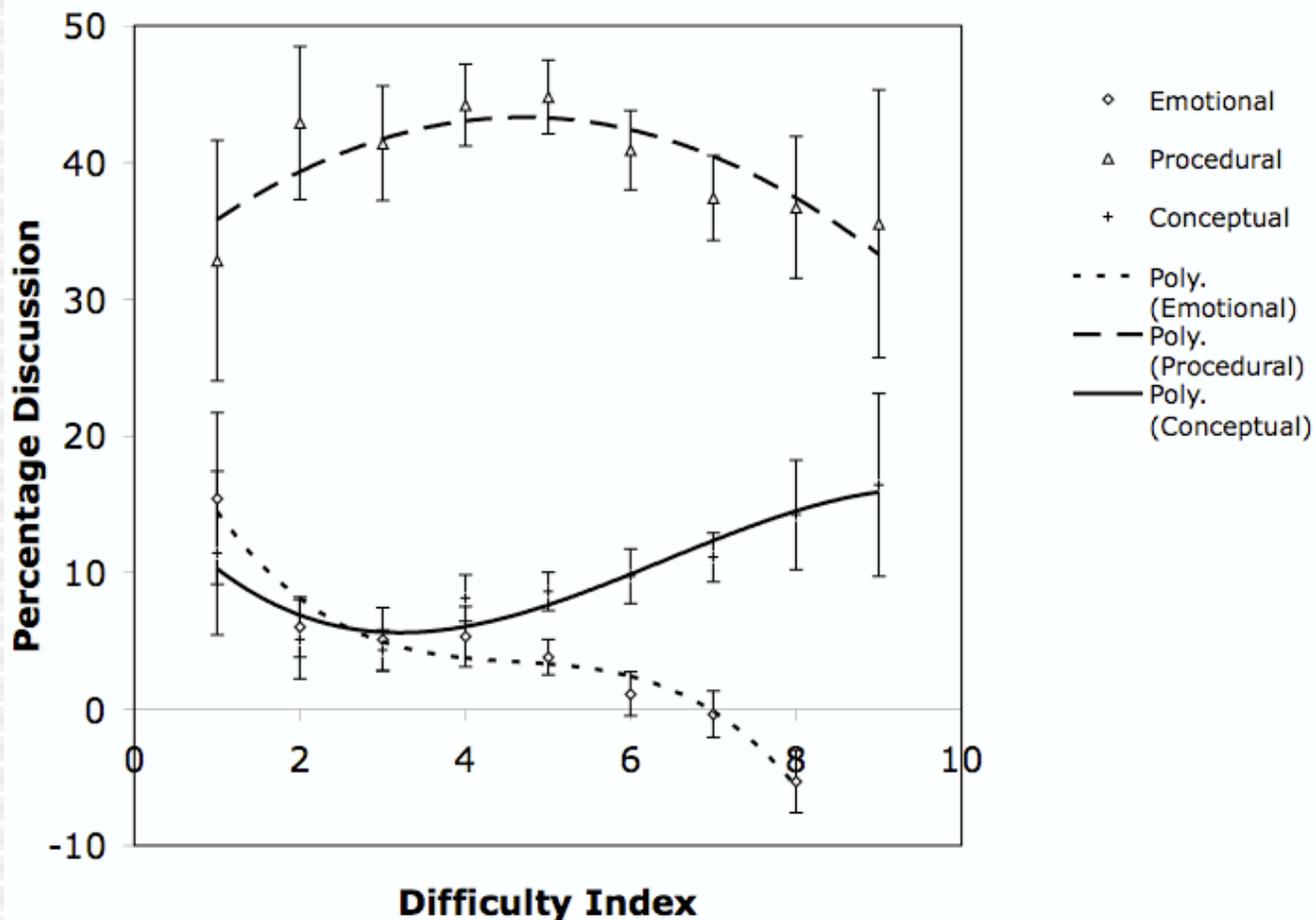

Classification

- Classification of discussion contributions
